Stopwatch didn't contribute much to the app in previous iterations. All it did was track time and count up without interacting with the rest of the app.

Stopwatch buttons were changed from saying start/stop to start/pause to have more aligned language with a conventional stopwatch.

Added a button for an option to switch stopwatch from a stopwatch to timer to allow a countdown instead of only count up and options to switch back to a stopwatch.

A dropdown menu and along with another button was added to allow the user to select which exercise they would like to store the elapsed time from the stopwatch/timer to.

Originally tracking time for an exercise was done through the usage of sliders and multiple buttons, this varies in how usable it was from user to user. While tracking exercises it lacked information on the amount of calories that were consumed during the exercise which is vital for the purpose of a health app.

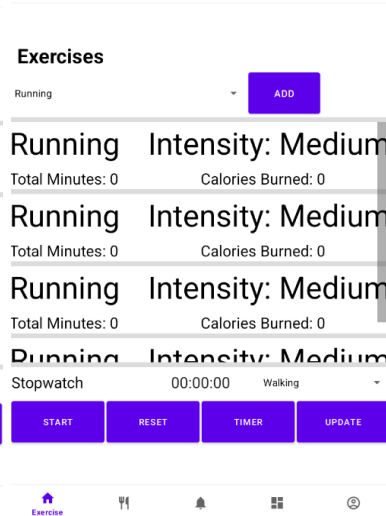

The overall design was changed and some functionality was removed due to other changes replacing the functionality. Instead of only displaying the exercise and total time spent on the exercise, it additionally displays the general intensity of the exercise for the user to understand along with calories burned performing the exercise.

Since time is now added through the stopwatch instead of sliders and multiple buttons it has been removed. Calories are now calculated individually for each type exercise depending on the time spent and is now displayed.

Before

After

The ability to scroll in the space dedicated to tracking exercises was always possible, however there weren't any indicators that showed the user that it's possible if they didn't make the attempt to scroll. This was a major usability issue due to the possibility of the user adding enough exercises to go off of the dedicated space and the user not attempting to scroll, making them unable to access the details due to them being off screen which is a result of not telling them that it's possible to scroll.

A persistent scrollbar is now added to the space when there are enough items for it to be possible to start scrolling.

Before

The 'Before' app interface shows a list of exercises under the heading 'Exercises'. The list contains four identical entries: 'Running' with 'Intensity: Medium'. Each entry has a 'Total Minutes: 0' and 'Calories Burned: 0' displayed below it. At the top right of the list is a purple 'ADD' button. Below the list is a stopwatch section with a timer set to '00:00:00' and a dropdown menu currently showing 'Walking'. At the bottom of the stopwatch section are four purple buttons: 'START', 'RESET', 'TIMER', and 'UPDATE'. The bottom navigation bar includes a home icon, the word 'Exercise', and four other icons.

After

The 'After' app interface shows a list of exercises under the heading 'Exercises'. The list contains three unique entries: 'Walking' with 'Intensity: Low', 'Running' with 'Intensity: Medium', and 'Push-ups' with 'Intensity: High'. Each entry has a 'Total Minutes: 0' and 'Calories Burned: 0' displayed below it. At the top right of the list is a purple 'ADD' button. Below the list is a stopwatch section with a timer set to '00:00:00' and a dropdown menu currently showing 'Walking'. At the bottom of the stopwatch section are four purple buttons: 'START', 'RESET', 'TIMER', and 'UPDATE'. The bottom navigation bar includes a home icon, the word 'Exercise', and four other icons.

Users were able to add multiples of the same exercise.

Now there's limit of one for each exercise that could be tracked to prevent duplicate exercises from being added

Complaints about this part of the app centered heavily on readability. Issues with its layout caused some elements to misalign themselves when rendered, and the information display of the screen itself was lacking, with items being badly grouped together and using small, difficult to read text. My edits both focus on fixing the layout's underlying technical issues, reevaluating how we utilize text sizes to emphasize and de-emphasize certain elements, and adding dividers where necessary to make the division between past workouts, daily goals, and general user information and goals more clear. Though it can't necessarily be shown through a screenshot, the filled areas are also an indication that the issues with the save button have been remedied.

NutritionTab: Hyun

Before

after

A complaint was that initial number for nutrition goals were 2000 and changed after info was added, set initial goals to what they are actually supposed to be.

Some complaints about the profile page were the lack of option and personalization and control. For now, added in an option to change the theme of the app and control it from the profile page,

put the name field in the profile page as that was another suggestion, that the name field would be more suitable in the profile, editable in both tabs for now.
Added in a goals option as well. To possibly later factor in.

Part B

- Total within around **1-2 months**
- Within Approx 1 week
 - Standardize design format, high priority
 - Apply consistent layout to all pages
 - Apply consistent color to all pages
 - Apply consistent text size
- Within ~ a week
 - Editing profile page
 - Familiarize ourselves with the code at hand; the work in this tab was done by someone no longer with our group.
- Within ~ half a week
 - Nutrition Page
 - Familiarize ourselves with the code at hand; the work in this tab was done by someone no longer with our group.
- ~ 2 week or more
 - Make different measurements, like weight, properly interact with different pages and have the measurements be defined properly
 - Proper communication between tabs, so like calories and stuff should be tracked properly
 - Add proper visual representation of information, progress bars, graphs and such

- ~ One Day
 - Change tab icon, low priority but should still be done
- ~Half a week
 - Be able to edit workout plans
 - Higher cleaner looking calendar.
- Then work on pushing out onto actual app stores for beta version ~ Half a week.

Part C Assumptions

- How to read data, progress bars, graphs, and such, for example how to read hours, minutes, and seconds
- Understanding of health terms like bmi, calories, nutrition
- Has experience with basic app functions like tabs and navigating them
- Has an explicit goal they want to achieve, more specific than “get healthier”
- Understands how to do proper scheduling
